App Name:
Cub Clicker

App Domain:
Game, Idle/Incremental, Casual

Description of App:
Cub Clicker is an incremental clicker game where players tap a bear cub to earn points, the in-game currency. The app has three main screens:

- **Gameplay:** The main screen, where the player taps the cub to earn points. A running total shows the player's total, along with their per-tap and per-second rates. Each tap gives visual feedback, like the cub bouncing and a "+N" number floating up.
- **Upgrades:** Players spend points on two kinds of upgrades. Click upgrades increase per tap and passive upgrades give incremental passive points. Each upgrade gets more expensive every time it is bought, so the player has to decide what to buy next.
- **Boss Encounter:** A timed challenge where the player has to deal a set amount of damage to a boss before the countdown runs out. Beating the boss earns special upgrades or multipliers that can't be bought with honey. Losing sends the player back to keep building up before trying again.

Progress is saved, so players can close the app and come back later to keep growing.

Outside Research:
Cookie Clicker is a popular browser and mobile game where players click a giant cookie and buy buildings that bake cookies automatically. Clicker Heroes is a similar game where tapping deals damage to monsters, and players advance through zones with timed boss fights.

Cub Clicker combines the two. It takes Cookie Clicker's satisfying economy of tapping and passive income, and adds Clicker Heroes' timed boss fights. Unlike in Clicker Heroes, though, our bosses aren't a gate the player must pass to progress, they are an optional.

Expected Obstacles:

1. **Passive generation and the boss timer:** Points need to accumulate every second, even on other screens, and the boss fight needs an accurate countdown. Neither kind of background timer has been covered in depth in class.
2. **Saving progress and offline earnings:** Players should keep their points and upgrades when they close the app, and ideally earn some points while they're away.

3. **Animations:** Tap feedback, floating numbers, and the boss health bar all need smooth animations to make the game feel satisfying.
